9.1.6. External causes/interruptions making a break of a Group

If things shown below happen, it is necessary for a Group to be properly handled as mentioned below (mostly by removing client(s) from the master. Refer to 13.2.2, procedure #2);

1. In case a Device's input is selected to others than MusicCast Link
 - If a Device is the master, nothing matters
 - If a Device is a client, it needs to be removed from the Group, meaning:
 - Remove the client from the master
 - Clear the Group ID in the client
2. In case a Device is assigned to the other Group for some reason
 - If a Device is the master, all client(s) assigned to it need to be removed from the Group
 - If a Device is a client, it needs to be removed from the master

9.1.7. Note to making Group

1. In case of Multi Zone Receiver, each Zone is unable to join to another group discretely.
